

Building Systems and Sustainability through a New Public-Private Partnership for Technology and HIV/AIDS

After 25 years of the AIDS epidemic, low- and middle-income countries still struggle to cope with the overwhelming task of providing prevention, care and treatment services in resource-challenged settings. This challenge presents an opportunity for the private sector to contribute much-needed innovation while the public sector shares information about the ever-growing global health community, where funding agencies increasingly demand practical, sustainable systems and information technology infrastructure. Because entry points into this market are often from information about how to protect their own workforce and supply chains and develop markets in, and products for, AIDS-affected regions.

In a public-private partnership, the private sector can contribute much-needed innovation while the public sector shares information about the ever-growing global health community, where funding agencies increasingly demand practical, sustainable systems and information technology infrastructure. Because entry points into this market are often from information about how to protect their own workforce and supply chains and develop markets in, and products for, AIDS-affected regions.

Building Hope for the Future

The technology & HIV/AIDS working sessions will seek to develop practical projects that information technology companies may join to address the global HIV/AIDS pandemic in heavily AIDS-affected countries and emerging markets.

Barriers to the Global Response to HIV/AIDS

Challenges include the low number of medical service providers, the knowledge gap between those providers, and the lack of medical records and longitudinal information needed to evaluate the successes and failings of prevention, care and treatment capacity. Ethiopia, for example, has only 700 trained pharmacists for a population of 75 million. 'Lack of capacity' refers not only to issues of human capacity; but also to system or organizational capacity and capacity for effective communication.

'Lack of capacity' refers not only to issues of human capacity; but also to system or organizational capacity and capacity for effective communication.

The U.S. President's Emergency Plan for AIDS Relief is the largest commitment ever by any nation for an international health initiative dedicated to a single disease.
